	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Write the Bash script to edit README.md that adds a blank space to the text ● Create GitHub Action file to run it on a daily schedule ● Automate git commit and git push inside the github actions workflow.	**Schedule - (For V2.0+)** ● Add logic to automatically skip commits when a commit has already been made. ● Randomize the daily commit time so updates look more natural. ● Alternate between adding and removing spaces so as to not add too much extra space.
Not Important	**Delegate - (Use a library)** ● Send a discord notification when the commit has been made using an external webhook action ● Sends an email when the commit has been made or failed to run. Use the existing GitHub Action for email notifications ● Use built-in tar and cron system tools rather than writing a separate archiver/scheduler.	**Delete - (Cut it)** ● Build a desktop GUI app to control the daily commit timer. ● Support multi-user account switching to manage commits across multiple github profiles. ● Create a web dashboard to monitor commit history.
